

Project 3 Computer Security

Starts April 2, due May 1

This assumes that you have read the pen-testing module.

By Eastern, lucy.mscs.mu.edu will become operable on port 80. Just direct your browser to lucy. There you will find a page that directs you to several webpages. All of them have easy to discern security problems. Find as many as possible and document exploits. By the way, I did not bother to get a certificate, so the connection is not secured via https. This actually makes it easier to use wireshark to observe the traffic between your machine and lucy. You can use all reasonable tools.
